

Hva er cloud og virtualisering? Og hvorfor trenger vi det?

Mobil Agenda – 06.06.2017

Isabelle Tardy og Aida Omerovic – SINTEF Digital

The 5G promised land

- ✓ Umbrella covering all legacy 2G-4G +
 - ✓ Mission critical communication
 - ✓ Things and people
- ✓ Challenges
 - ✓ Higher capacity
 - ✓ Lower end-to-end latency
 - ✓ Massive device connectivity (IoT)
 - ✓ Consistent QoE
 - ✓ Reduced OPEX and CAPEX costs

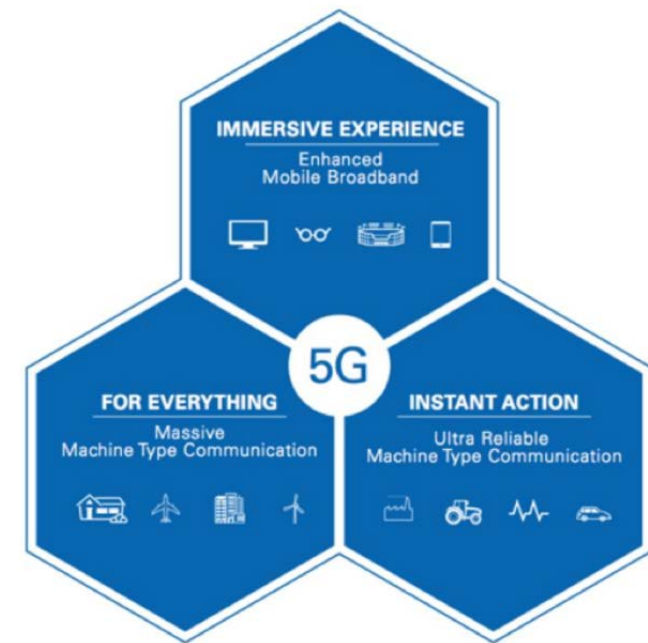

3 service categories of 5G

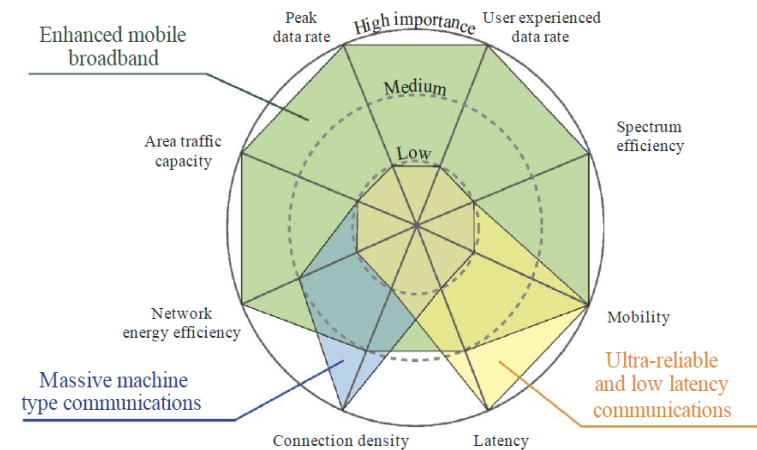

- ✓ eMBB
 - ✓ capacity enhancement
- ✓ Massive machine type communication (mMTC)
 - ✓ 106 devices /km², 99.9 % availability, 125 b/s *
- ✓ Critical machine type communication (uMTC)
 - ✓ High reliability (10⁻⁵) success, latency < 0.5 ms *

5G will support applications with very different requirements
→ Need for flexible, "elastic" solutions

* TR22.891

Software network technologies in 5G - virtualization

- ✓ The overall network should be SW-(re)configurable in order to address conflicting requirements
- ✓ Decoupling of SW and HW = virtualizing
- ✓ Reuse of infrastructure resources (SW and HW platforms) 😊
- ✓ Network Slicing
 - ✓ Deployment of multiple logical networks as independent business operations
- ✓ Future-proofing design as updates can be easily and swiftly implemented by SW 😊

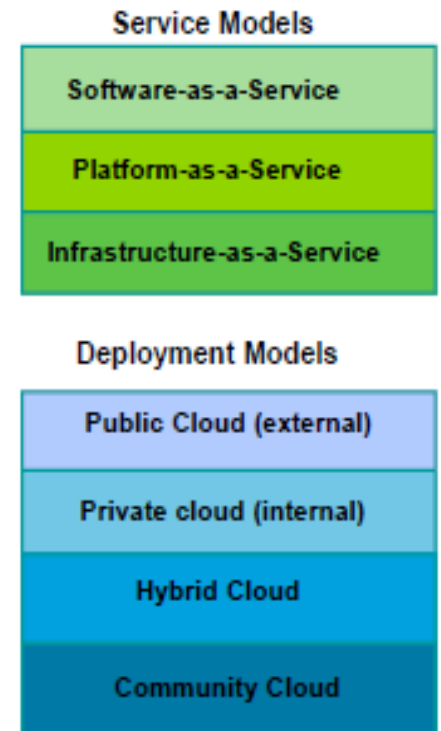

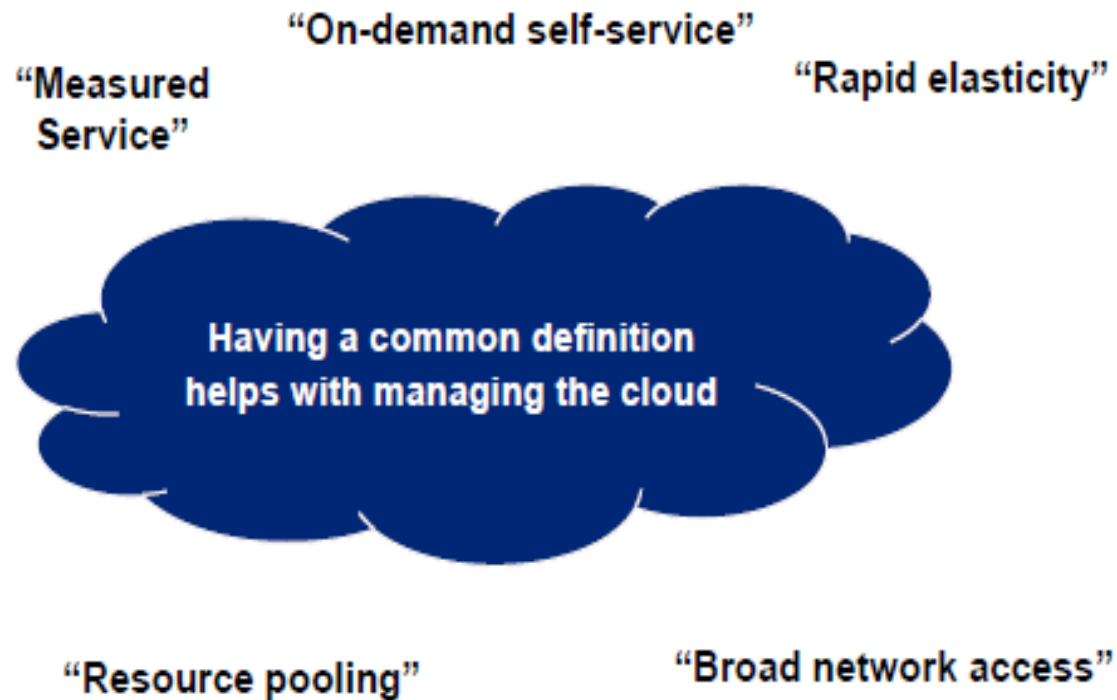

Virtual Network Functions in 5G

- ✓ Extension of the notion "resource"
 - ✓ The VNFs will play an important role especially in the design of Core Network functions
 - ✓ Connectivity; filtering, forwarding, packet inspection
 - ✓ Computation; virtual machines, SW running on top of high-volume platforms, switches...
 - ✓ Storage; database functionality - inside or edge of network
- ✓ VNF are defined regardless of physical infrastructure
 - ✓ Mapping to physical architecture in a service-specific way
 - ✓ Flexible instantiation 😊
 - ✓ Avoids vendor lock-in 😊

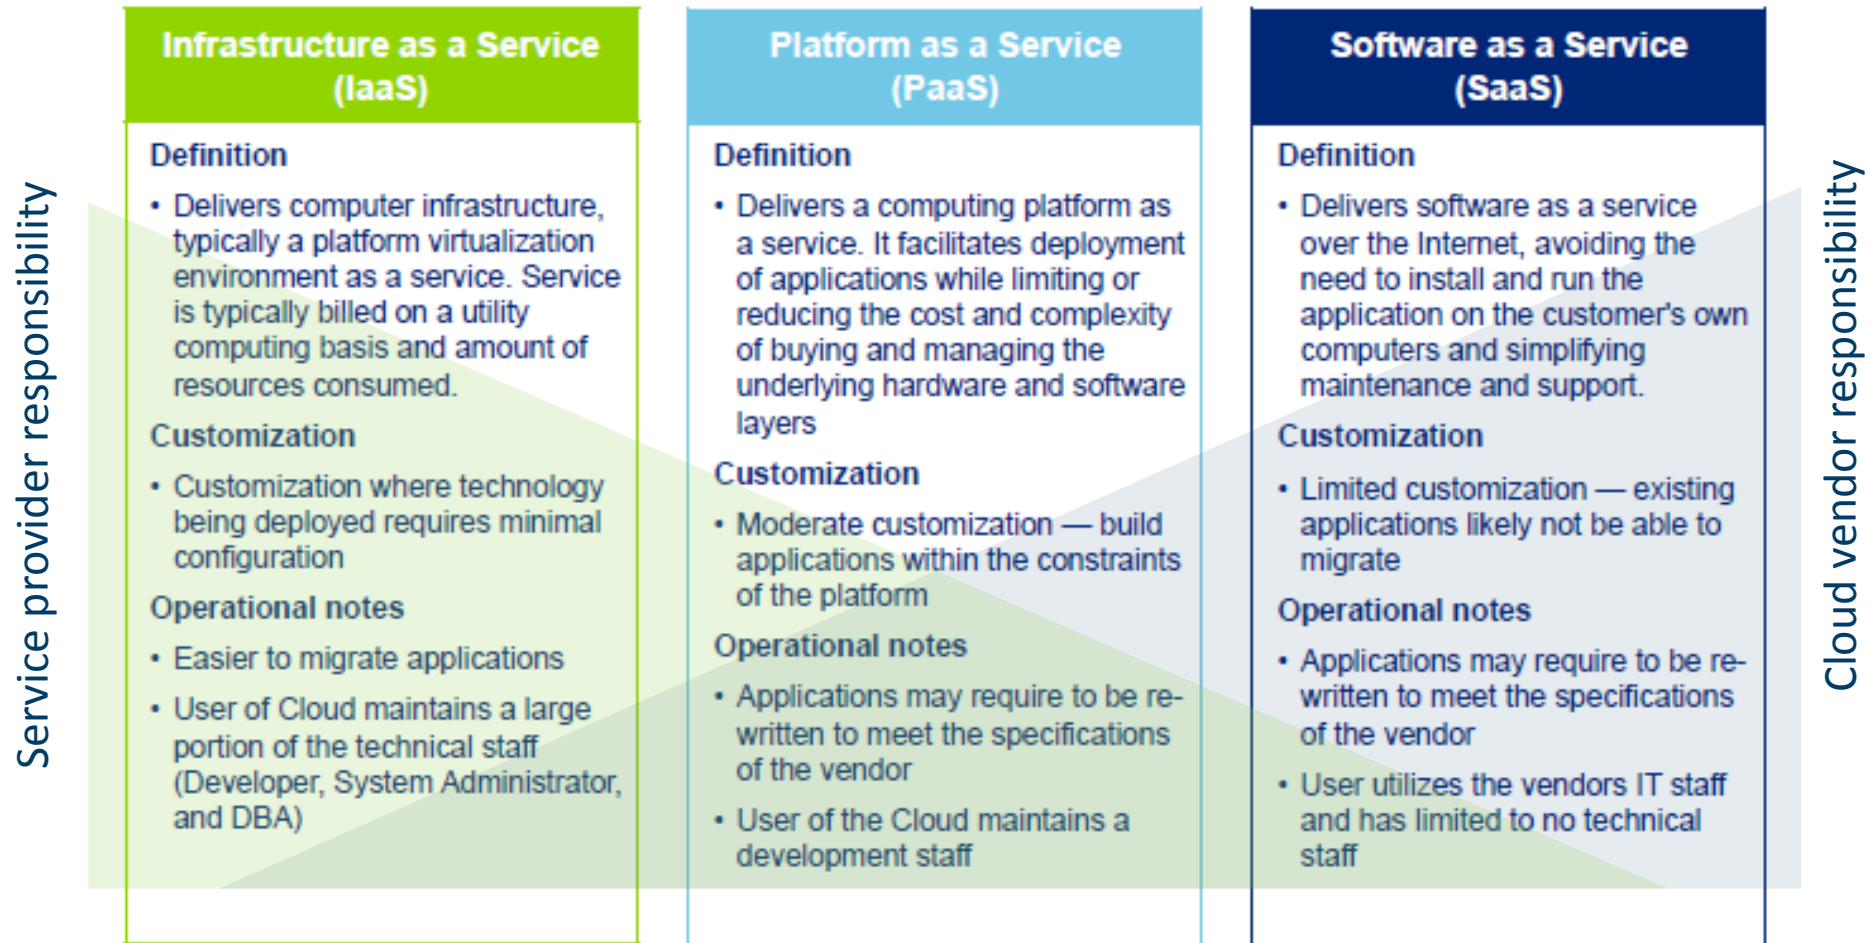

What is cloud computing?

- ✓ NIST 800-145 definition:
Ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources

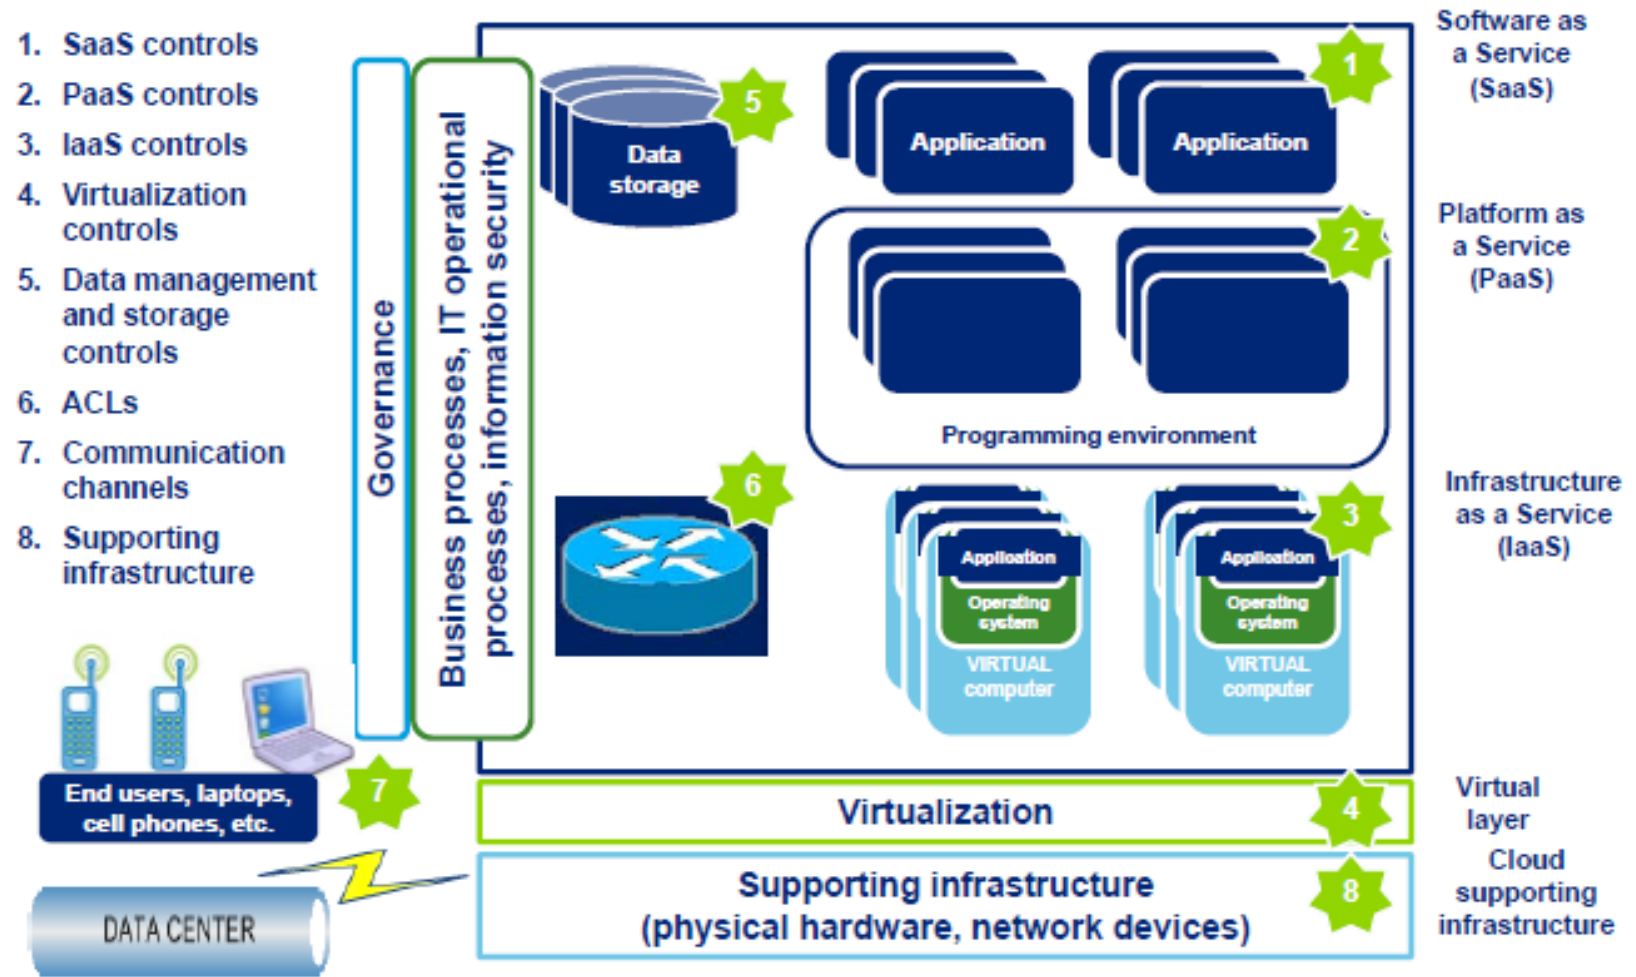

Cloud computing: service delivery

"As A Service" trend =

Combining virtualization and cloud

- ✓ Network and virtualization layer links cloud services and providers of data centers
- ✓ Control points are spread

Virtualization and cloud environments

- ✓ Ecosystems; 3rd parties and vendor chain. From integration of services and platforms to more open market place
 - ✓ 5G-centered umbrella
 - ✓ De-centralized approach
- ✓ Multi-cloud environments for different slices / KPIs
- ✓ Combination of cloud services
- ✓ Best of breed 😊
- ✓ Redundancy and always available services 😊
- ✓ Develop and roll-out new services in a very short time 😊

Previously separated ecosystems are converging into a fully integrated system – the connected society

Telia report "Connected things. New digital ecosystems – unlocking the growth potential of IoT", 2017 edition.

Risks in the context of clouds

- ✓ Risks are spread
 - ✓ Virtualization layer
 - ✓ Service: IaAS, PaAS, SaAS
 - ✓ Deployment: private vs. public clouds
 - ✓ Business models
 - ✓ Net neutrality vs. slicing
- ✓ Some examples of good conduct:
 - ✓ Manage authentication and access
 - ✓ Select cloud service providers that respect regulatory frames
 - ✓ Oversight and updating of all cloud service providers
 - ✓ Define privacy processes, monitor and revise privacy statements if necessary
 - ✓ Develop security management procedures across delivery chain

A particular risk: privacy

- ✓ Personally Identifiable Information (PIIs)
 - ✓ Strict legal definition or information leading to person identity
 - ✓ Individual identity (name, social security number, date and place of birth, biometric record...)
 - ✓ Medical, educational, financial, employment information that can help deducing identity
 - ✓ MAC and IP addresses not strictly PII but need protection
- ✓ Ecosystem of PII-dependent digital services is growing
- ✓ PII are collected, stored, exchanged, and applied by different kinds of services....(*)
- ✓ New European law (**) enforcing right to be informed of PII status and possibly to deletion of own PIIs
 - ✓ -> Traceability in the cloud-based network architecture
 - ✓ Important in case of intrusion

• A. Omerovic, M. Natvig, I. Tardy, "Privacy Scorecard – Refined Design and Results of a Trial on a Mobility as a Service Example", accepted for publication in the proceedings of the 27th European Safety and Reliability Association Conference (ESREL) 2017.

** European Parliament, Council of the European Union. Regulation (EU) 2016/679 - *Protection of natural persons with regard to the processing of personal data and on the free movement of such data*, 2016.

Measures enforcing privacy in a cloud context (*)

- ✓ Non-disclosure
 - ✓ Clear policy to specify how the cloud provider may access customers' data
 - ✓ The cloud provider may not disclose any of the customers' data to 3rd party, unless previously agreed
 - ✓ The cloud provider will only disclose customers' data to 3rd party on a need-to-know basis
- ✓ Anonymity
 - ✓ The cloud provider will not provide common logs to any other customer or 3rd party
- ✓ Data minimization
 - ✓ The cloud provider will only require the minimal set of data necessary to perform the service
- ✓ Data processing agreement (DPA) statements
 - ✓ The data processor will only act upon instructions from the controller
 - ✓ The data processor will comply with the same security obligations as the controller itself
 - ✓ No change during the lifetime of the contract unless there is consent from the customer

** SINTEF report n.A27131*

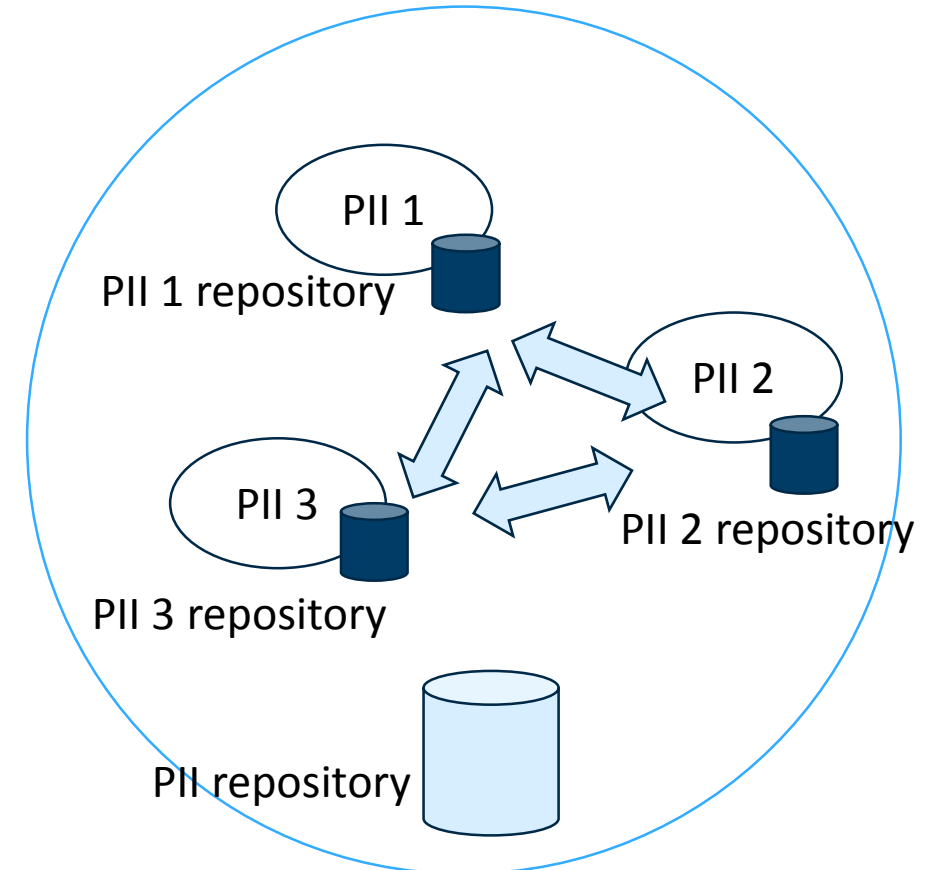

A concrete case; the smart home (1/2)

- ✓ A highly private sphere
- ✓ Several services
 - ✓ 3-play or individual Internet, broadcast, tel-services
 - ✓ Alarm
 - ✓ Distance heating, appliances control
 - ✓ Smart meters
- ✓ Services connected to individual clouds
- ✓ Alternatively, local aggregated control through cloud-enabled routers with dynamic deployments and instantiations

A concrete case; the smart home (2/2)

- ✓ Examples of PII to each service 1, 2, 3
 - ✓ Full name
 - ✓ Physical address
 - ✓ Tel-number, email @, MAC @
 - ✓ Favourite TV channels, web sites
 - ✓ Payment details
 - ✓ Energy consumption log
- ✓ When no connection nor coordination between services,
 - ✓ Only PII to that service need to be known
 - ✓ No exchange of PIIs across services
- ✓ Coordination
 - ✓ Risk of exchanging PII not necessary to all services but common denominator as a single stakeholder treats PII

Conclusion

- ✓ Service enhancement is case-dependent and relies on clouds
- ✓ Elastic resources
- ✓ Swift time-to-market and updates
- ✓ Redundancy and resiliency
- ✓ Many stakeholders, responsibility must be ensured to retain confidence
